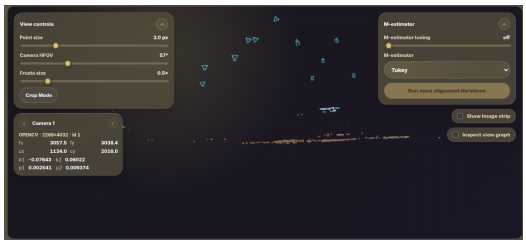
Colmap Experiment

As you can see in Figure 2, With more images, there are more points that were plotted. I decided to try and make different .obj files using 10 and 19 images. The colmap application that I used can be found here. I decided to use the default 200px thumbnails with exhaustive keypoint matching. This is still not as good as I would like it to be. It would be nice if we could just take all the frames from a video and construct the objects from there.

It seems like a lot of the table was mapped (a lot of the brown dots in a line were mapped). The smooth surface of the bag made it hard to extract key-points, so only light blue from the text or zipper seemed to show up. I probably would have gotten better results if I took a picture of the scene or something.

Figure 1: All images used.



(a) Map using 19 images.

(b) Map using 10 images.

Figure 2: Significantly more detail with the mapping from more images.
